

CLAIMS

What is claimed is:

1. A system for integrating core banking business processes, comprising:
a business platform wherein two or more selected banking processes common to the core
5 banking business are integrated, including at least one database for sharing data between said core
banking business processes to provide said system with customer and business information;
a basic business rule library comprising two or more basic business operations to be
implemented;
a common function library comprising at least one common function program called by
10 said basic business operations; and
an application-business subsystem comprising a combination of said basic business
operations.

A

2. The system of claim 1, wherein said core banking processes comprise at least one of
current deposit, fixed deposit, loan, settlement, credit card/deposit card, accounting, electronic
15 remittance, clearance, or account book processes.

3. The system of claim 1, wherein said business platform comprises:
an online transaction module;
a database interface module;
an online batch process module;
20 an online report module;
an external interface module; and
a testing driver module.

4. The system of claim 1, wherein said business platform comprises:
an accounting process module; and
an error correcting module.

5. The system of claim 4, wherein said accounting process module comprises an
5 accounting server coupled to a fixed interface for performing selected transactions.

6. The system of claim 1, wherein said basic business rule library includes means for
initiating a first business operation and means for transferring data from said first business
operation to selected other business operations.

7. The system of claim 1, wherein said system further comprises first generator means for
10 creating data layout and memory tables for said system.

8. The system of claim 7, further comprising a data dictionary for providing input
data to said generator means.

9. The system of claim 8, further comprising:
second generator means for creating accounting process tables;
15 third generator means for providing database access;
fourth generator means for providing file access; and
fifth generator means for creating reports.

10. The system of claim 1, further comprising at least one program framework means for providing the program structure and common process and common data definitions for said business operations, wherein a template is provided for the integration of said business operations.

5 11. A method for integrating core banking business processes, comprising the steps of:
 creating a business platform wherein two or more selected banking processes common to
the core banking business are to be integrated, said business platform including at least one
database for sharing data between said core banking business processes to provide customer and
business information;

10 creating a basic business rule library comprising two or more basic business operations to
be implemented;
 creating a common function library comprising at least one common function program
called by said basic business operations; and
 creating an application business subsystem comprising a combination of said basic
15 business operations.
